                                                                                                                                                                                                                                                                                                                              Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAX42265 to AAX43075 represent novel 5' expressed sequence tag (EST) sequences, corresponding to human secreted proteins. AAX4651 to AAX4538 represent the EST-related proteins corresponding to AAX42265 to AAX43052. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in foremste procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The protects encoded by the EST sequences may be useful in treating a polyperide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treating a variety of human conditions. Secreted proteins have
therapeutic value, and the identification of new secreted proteins is
valuable. AAZ42240 to AAX42264 and AAX64644 to AAX64650 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; Page 195; 837pp; English

Agostino P Racie LA, New polynucleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, WPT; 1999-070078/06 (GEMY) GENETICS INST INC 10-APR-1997; 10-APR-1998; 15-OCT-1998 A, Spaulding 97US-0837312 98WO-US06956 < 7 Lavallie | Treacy M; ER, мссоу JM, Merberg

The present sequence represents an expressed sequence tog (EST), and is a polynucleotide of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or machiorating medical conditions in humans and animals, although no supporting data is given. Suggested activities and include nutritional activity, humans stimulating or suppressing activity, haemstopolasis regulating activity, tissue growth activity, hemostatic activity, inhibit activity, receptor/ligand activity, anti-inflammetory activity, codherin/tumour invasion suppressor activity, theoret inflammetory activity, codherin/tumour invasion suppressor activity, to activity, activity, activity. BST sequences are also stated to be useful for gene

transgenic nonhuman mammals comprising a GH-induced transgene which exhibit or have a propensity to develop a liver pathology; an assay for drugs which inhibit the development of, or which treat all liver pathology, comprising administering the drug to the transgenic animal; and preventing or treating a liver pathology in a patient comprising administering a drug which inhibits the expression of a 6H-induced gene. The method of the invention is used for dispossing abnormal levels of GH S-2 hydroxyacid oxidase, interferon alpha/beta receptor, growth hormone receptor, proteasome z-subunit, and coogulation factor V. Two novel quest, clone 5 (AACGPT25) and clone 45 (AACGPT28) are also upregulated in response to abnormally high GH levels. Conversely, expression of the gene encoding 3-beta-hydroxysteroid dehydrogenase/delta-5-delta-4 isomerase appears to be downregulated. The invention also relates to growth hormone identified a number of genes whose expression in the liver is altered by high GH levels. The genes which are upregulated are those encoding alpha-fetoprotein, corticosteroid binding globulin, fetuin, rab8-interacting protein, paraoxonase-3, cytochrome P450IIIA, activity in the liver is thought to be deleterious to health, causing an increase in liver size as a consequence of both hyperplasia and hepatocyte hypertrophy, and hepatocellular lesions which progress with age. Studies in transgenic mice which express high levels of bovine activity in the liver or predicting a change in the condition of the liver in response to abnormal levels of GH activity. The GH-regulatable liver genes and proteins are useful as diagnostic markers of liver pathology. Assays for the expression of these genes is useful for the The invention relates to a method of diagnosing abnormal levels of growth hormone (GH) activity in the liver, or predicting a change in the condition of the liver in response to abnormal GH activity. The method with the level of GH activity in the liver, or with an expected change in the condition of the liver as the result of GH activity. Excessive involves correlating the level of expression of certain specific genes with diabetes, as other causative agents may act directly or indirectly upon the same genes. The present sequence represents the novel mouse liver cDNA clone 5, expression of which is upregulated by abnormal GH diagnosis of liver pathologies associated with gigantism or acromegaly or

LIR coding sequences may be used in the gene therapy of disorders mediated directly or indirectly by defective or insufficient amounts of any of the LIR polypeptides. The LIR polypeptides can be used to treat autoimmune diseases and disease states with suppressed immune function.

The sequence represents the coding sequence of human MANGO 511 variant #2 transmembrane protein. The nucleic acid and polypeptide sequences are useful for the diagnosis, prognosis and treatment of immunological disorders (e.g. arthritis, graft rejection and acquired immunodeficiency syndrome). Inflammatory disorders (e.g. psortiasis and asthme), renal disorders, embryonic disorders, brain-related disorders (e.g. sections), ocrebrowascular diseases (e.g. schemila) tumours, prostate-related disorders, pituitery-related disorders (e.g. useful and performer protections).
